General Characteristics of Medical Devices

- Designed to prevent accidental activation during transport.
- The transparency of the syringe body allows a view inside the syringe.
- Quick connect system compatible with existing packaging of other solutions on the market.

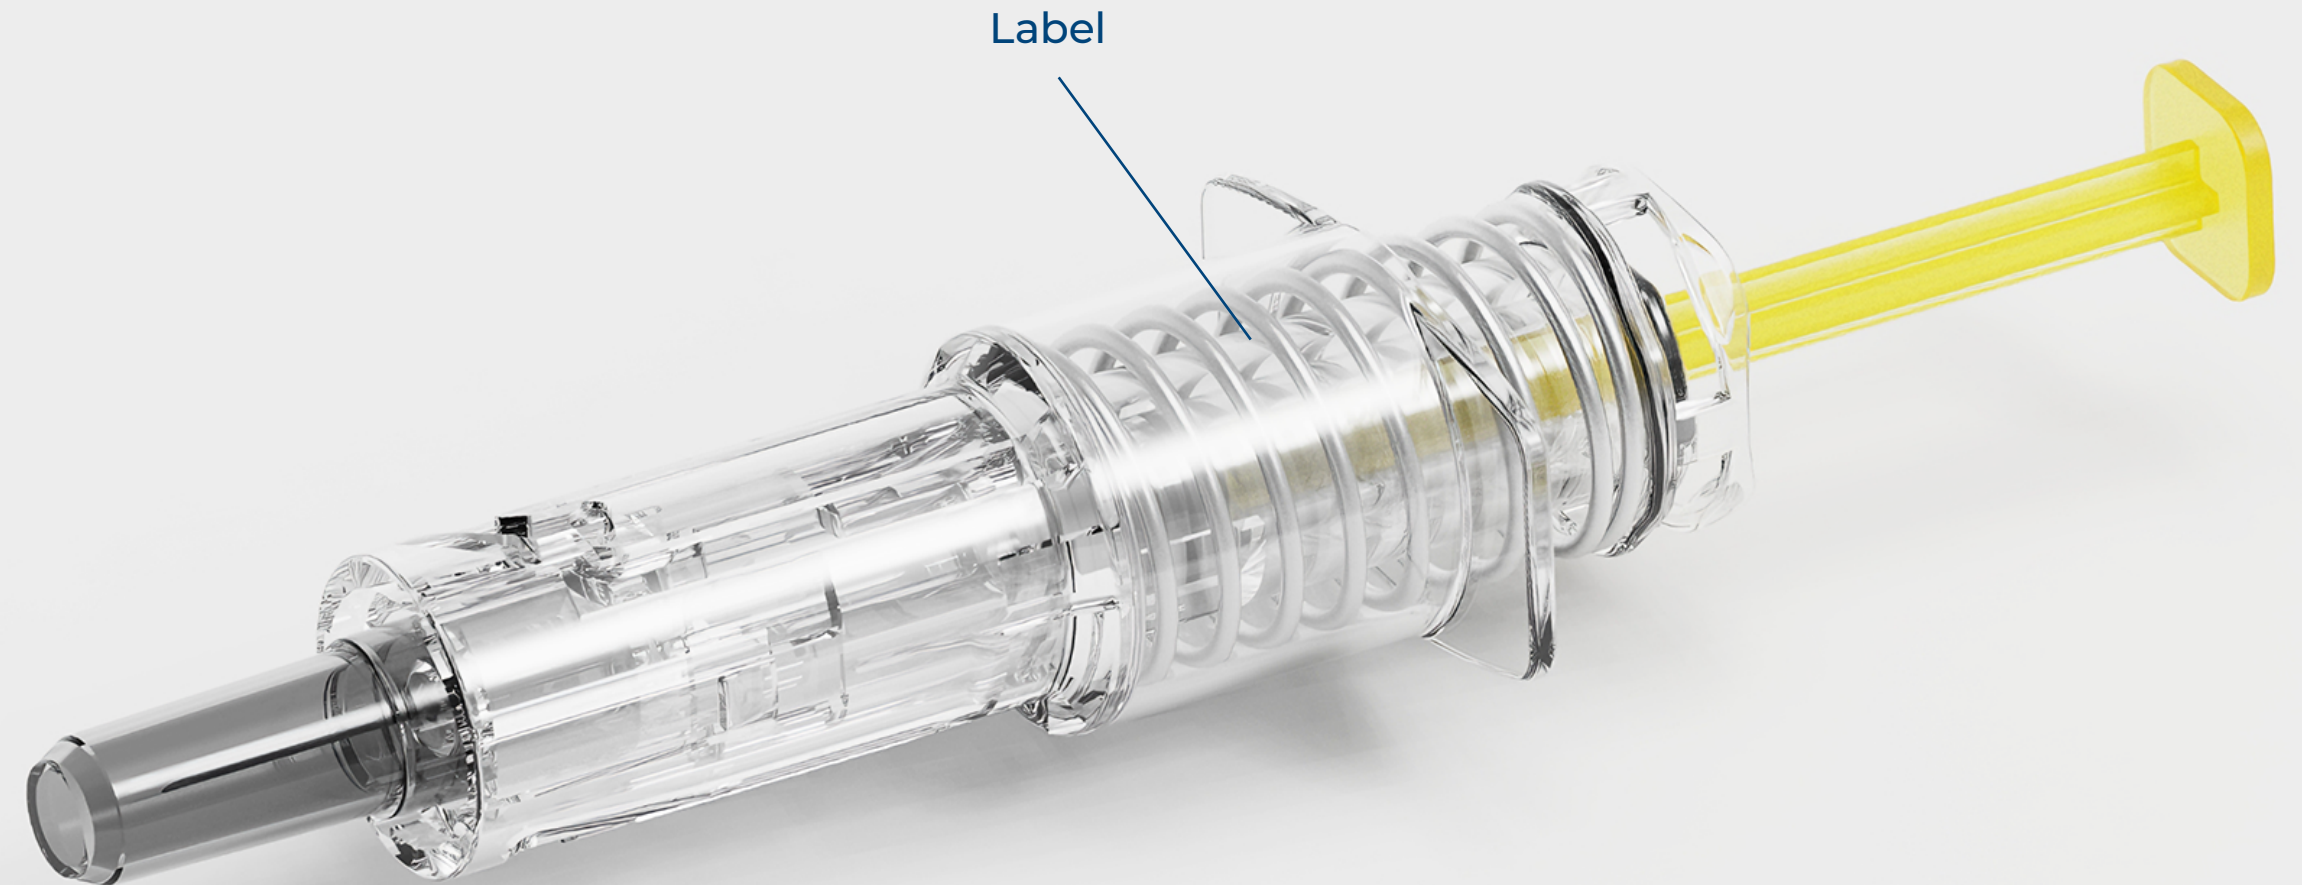

Syrlock

Activation system: Active, allowing the healthcare professional to have direct and conscious control over the activation, thus ensuring the intentional and safe implementation of the device.

Compatible syringe sizes: 0.5 and 1 ml, allowing flexibility in drug dosing. This syringe can be adapted to different sizes.

Labelling on device: Yes, improving identification and reducing errors.

Click-on-activation effect: Yes, it provides an audible click to signal that the safety mechanism has been successfully engaged. This auditory confirmation is a critical feature for healthcare providers, ensuring that the device is secured and ready for safe use.

Isansafe

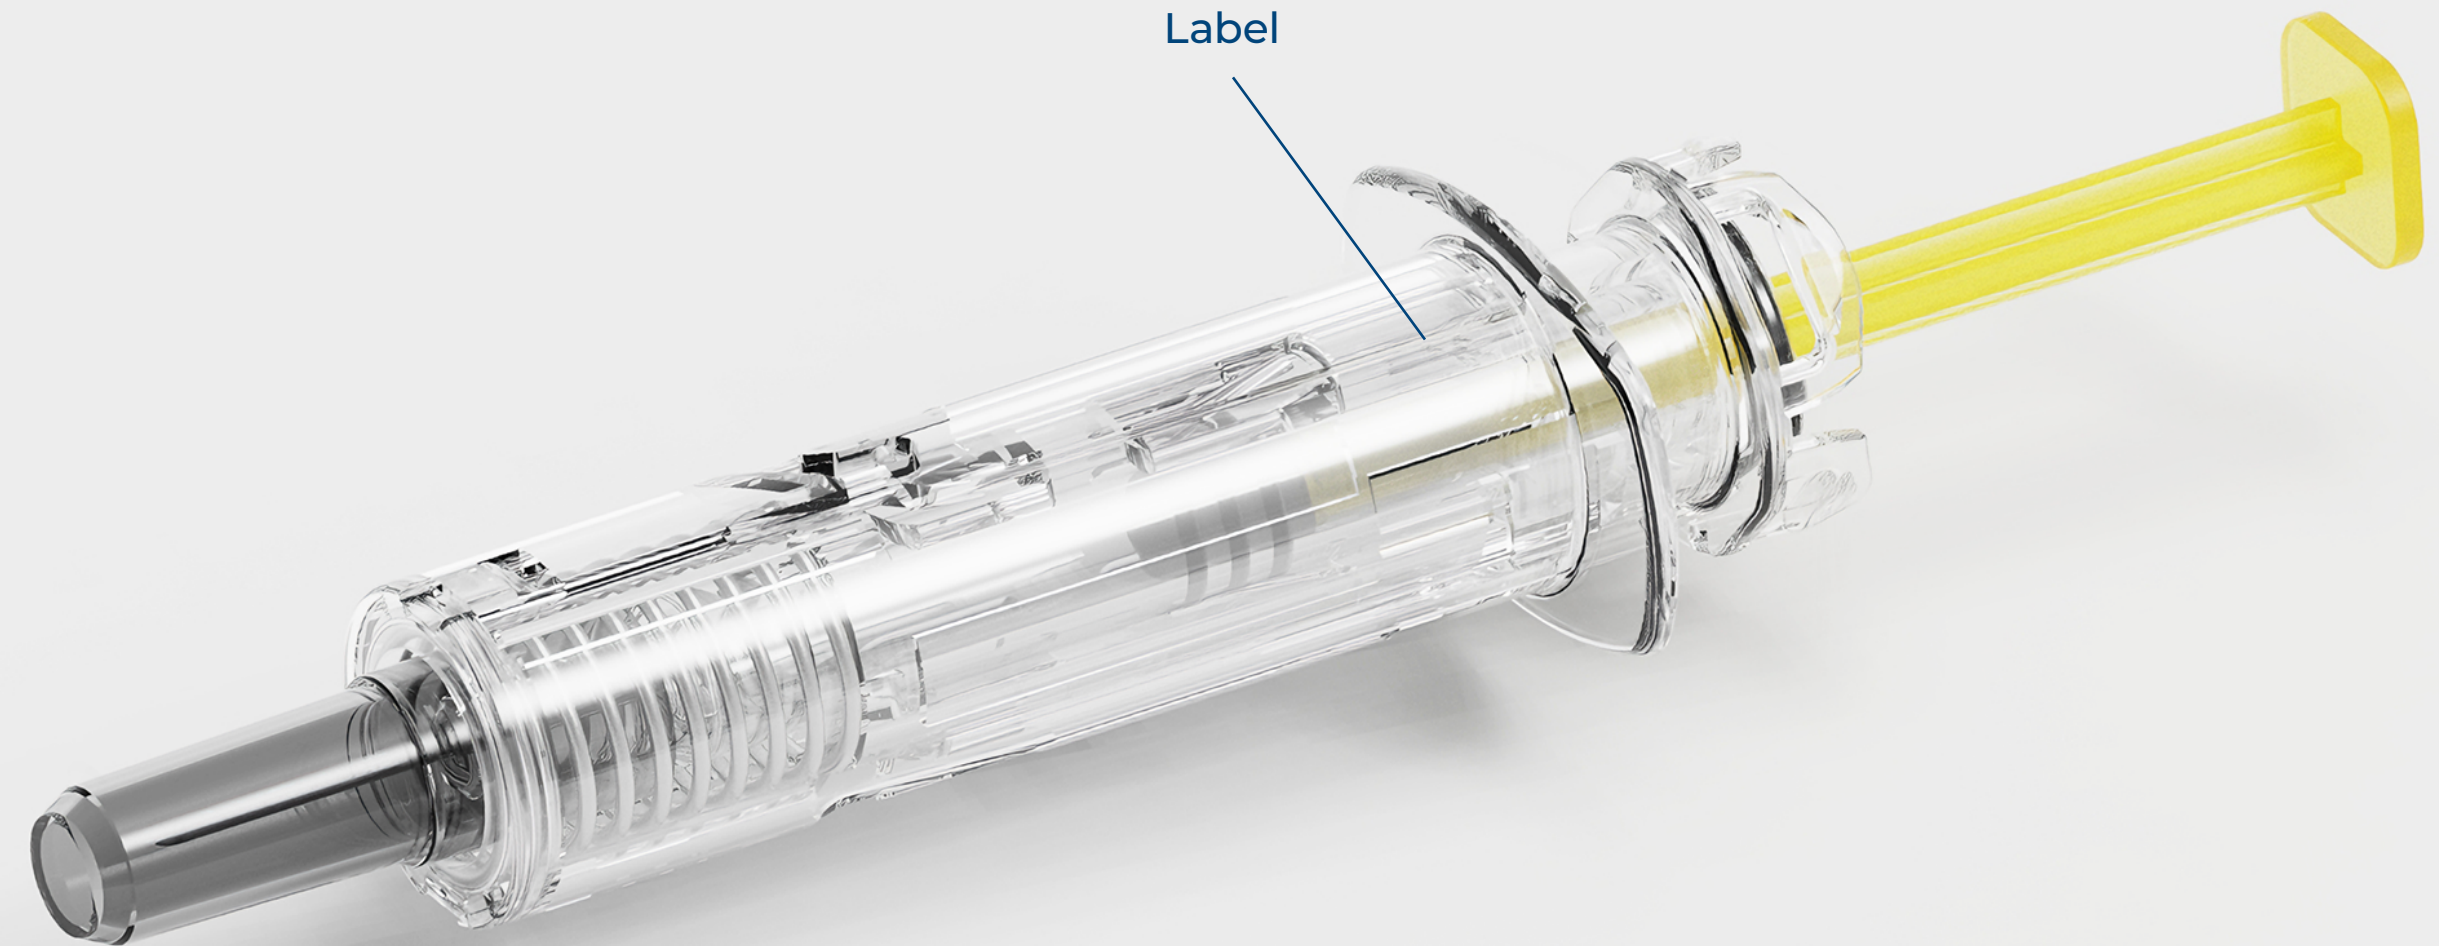

Activation system: Active, optimising safety and minimising additional steps during administration.

Compatible syringe sizes: 0.5 and 1 ml, maintaining versatility in dosing options.

On-device labelling: Yes, facilitating correct identification of contents.

Click-to-activate effect: Yes, ensuring that healthcare staff receive auditory confirmation of activation.

Different colours on the device tip: Yes, this feature provides an additional layer of security by allowing quick and visual identification of different medications or concentrations.

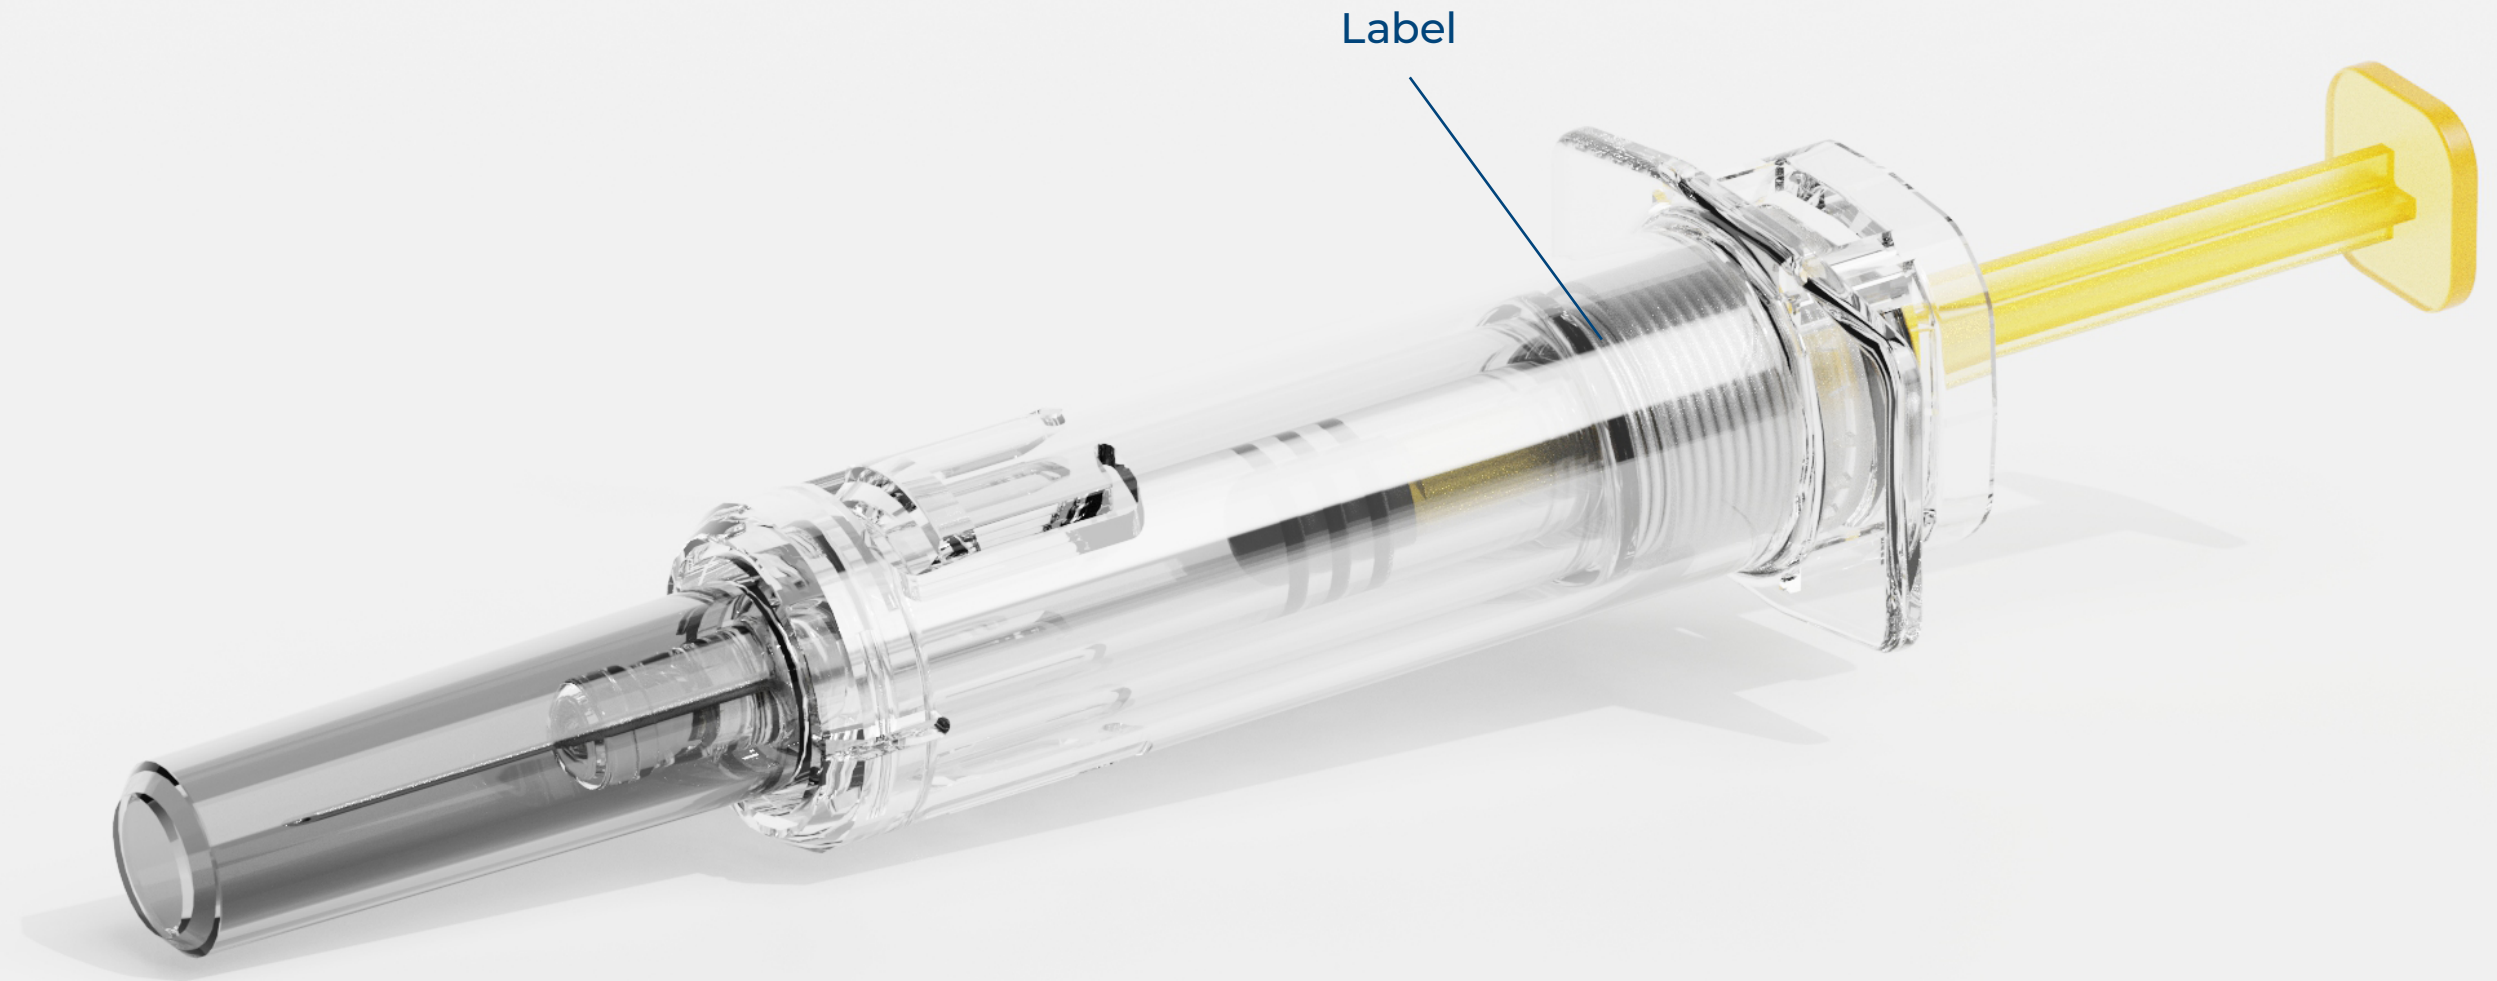

Sureshot

Activation system: Active, requiring an intentional action by the user to activate the safety mechanism.

Compatible syringe sizes: 0.5 and 1 ml, offering the same size options as the passive models.

Labelling on the device: Yes, providing clear product identification.
