- ▶ **old dogs**, to extend their active life at a higher age
- ▶ dog breeds prone to **joint problems**
- ▶ **athletic and working** dogs
- ▶ **rapidly growing** dog breeds
- ▶ dogs in **recovery**

THE BEST **SCIENCE FOR DOG JOINTS**

Geloren was developed by scientists and doctors so that it has an ideal composition and a properly balanced ratio of individual raw materials. Geloren contains the **most suitable variants of substances for joints in their highest quality**, which ensures the absorbability, safety and nutritional ability of the product. In addition, each batch produced is strictly inspected and tested.

Hyaluronic acid - The most important constituent of joint fluid. It functions in the joints as a joint lubricant, shock absorber and also prevents uncomfortable friction of the joint surfaces.

Chondroitin sulphate - An important component of articular cartilage and synovial fluid. Ensures flexibility, strength and resilience of cartilage.

Hydrolyzed collagen - A highly absorbable form of collagen. Collagen is important for tendon strength and overall strengthening of the musculoskeletal system. Collagen is one of the main building blocks of cartilage, tendons and ligaments, and also supports their regeneration.

Gelatin - A proteinaceous substance in a well digestible form that provides the basic building blocks for collagen production. Thanks to gelatin, the body produces a large amount of additional collagen by itself.

Geloren dog **chewing cubes** contain active substances for proper functioning of joints, ligaments and tendons.
