

RHIZOMK[®]

Overall Energy & Vitality

MEN'S HEALTH

INTRODUCTION

Testosterone deficiency is increasingly recognized as a significant health problem in men. It can adversely affect physical health, psychological health and libido. Consequently, the quality of life of men with low testosterone is negatively affected.

Healthy testosterone levels influence a broad range of men's health goals, from maintaining healthy libido to supporting optimal athletic performance. The maintenance of libido is a top health goal for at least 18 million men in the U.S. alone.

Testosterone supplementation may improve the testosterone level, which further improves the physical, libido and cognitive functions and improves mood and quality of life.

CLINICAL STUDY

An animal study was conducted to see whether 'Chronic administration of RhizomK[®], a standardized *Curculigo orchioides* root (black museli) extract, promotes free testosterone level in male rats.

BACKGROUND

Curculigo orchioides is a medicinal plant used for diverse medicinal purposes including impotency, aphrodisiac, diuretic, tonic, jaundice, and skin ailments for centuries. Phytochemical investigations of rhizomes revealed the presence of a novel phenolic glycoside, curculigoside, triterpenoid, saponins, flavones, cellulose, hemicellulose, and calcium oxalate. We developed a novel extract of *Curculigo orchioides* (RhizomK[®], standardized to 30% curculigosides) and assessed its dose and time-dependent efficacy (0, 10, 25 and 50 mg/kg body weight p.o.) in male rats.

METHOD

We assessed the body weight, serum free and total testosterone levels in male rats (200-230 g; n = 6) over a period of 28 consecutive days. Moreover, extensive histopathological analyses were conducted on the seminiferous tubules, spermatogenesis, sperm cell morphology, Leydig cells and Sertoli cells.

RESULT

RhizomK didn't cause any marked elevation in serum free testosterone levels at either 10 or 25 mg/kg body weight doses, however, a 50 mg/kg body weight dose of showed a significant increase in serum free testosterone level (*p < 0.0001). However, no significant increases were observed in serum total testosterone levels at 0, 10, 25 or 50 mg/kg body weight doses of RhizomK. Extensive testicular histopathological analyses including investigations on the seminiferous tubules, spermatogenesis, sperm cell morphology, Leydig cells and Sertoli cells following treatment with either 0, 10, 25 or 50 mg/kg body weight doses of RhizomK were conducted.

SAFTEY RESULTS

No significant changes were observed in serum SGOT, SGPT, BUN and creatinine levels on the following treatment with any of the doses.

CONCLUSION

The present study demonstrates that RhizomK may serve as a safe and novel, natural free testosterone booster and provide broad spectrum applications in sports nutrition, muscle building and exercise pathophysiology.
