02. ANTIMALARIAL

Antimalarial medications, also known as antimalarials, are designed to prevent or cure malaria. Such drugs may be used for some or all of the following:

- 1. Treatment of malaria in individuals with suspected or confirmed infection
- 2. Prevention of infection in individuals visiting a malaria-endemic region who have no immunity
- 3. Routine intermittent treatment of certain groups in endemic regions

03. ANTIVIRAL DRUG

Antiviral drugs are a class of medication used specifically for treating viral infections rather than bacterial ones.

- 1. Most antivirals are used for specific viral infections, while a broad-spectrum antiviral is effective against a wide range of viruses.
- 2. Unlike most antibiotics, antiviral drugs do not destroy their target pathogen; instead they inhibit their development.

04. ANTIPYRETIC ANALGESICS

Antipyretic analgesics are a group of heterogeneous substances including acidic (nonsteroidal antiinflammatory drugs, NSAIDs) and nonacidic (paracetamol, pyrazolinones) drugs. Moreover, various selective cyclooxygenase-2 (COX-2) inhibitors with improved gastrointestinal tolerability as compared with conventional NSAIDs have been established for symptomatic pain treatment in recent years. The present review summarizes the pharmacology of all of these drugs with particular emphasis on their rational use based on the diverse pharmacokinetic characteristics and adverse drug reaction profiles. Referring to the current debate, potential mechanisms underlying cardiovascular side effects associated with long-term use of COX inhibitors are discussed.

05. ANTIPARASITIC

Antiparasitics are a class of medications which are indicated for the treatment of parasitic diseases, such as those caused by helminths, amoeba, ectoparasites, parasitic fungi, and protozoa, among others.

Antiparasitics target the parasitic agents of the infections by destroying them or inhibiting their growth; they are usually effective against a limited number of parasites within a particular class. Antiparasitics are one of the antimicrobial drugs which include antibiotics that target bacteria, and antifungals that target fungi. They may be administered orally, intravenously or topically.

### 13. NUTRITIONAL SUPPLEMENTS

A nutritional supplement is a product intended to add further nutritional value to (supplement) the diet. A nutritional supplement may be one, or any combination, of the following substances:

- a vitamin
- a mineral
- an herb or other botanical
- an amino acid
- a concentrate, metabolite, constituent, or extract

Some nutritional supplements can help ensure that you get an adequate dietary intake of essential nutrients; others may help you reduce your risk of disease.
